

Tool Encapsulation in BlueJ

By Justin Singleton, Brian Leprowse, and Anna Krajeski

The Tools of the trade

Students can benefit from the use of many coding tools, the quality tools for BlueJ extension intends to deliver these to students in an easy to use extension that will put professional level development tools right in the students hands!

What are we doing to help?

The tools intended for this extension are many and they are of many different flavors. Is it a command line tool? What is the file extension? Was it developed in Java or some other language?

The Tool Encapsulation class is intended to make all of these questions irrelevant to users, as we will give developers one convenient class from which to get any tool working with the Quality Tools for BlueJ Extension!

Think of this class as a kind of adapter

You know that drawer you have in your house that is full of spare cords? You don't know what they go to, yet you don't want to get rid of them because you know you might need them one day!

If you had a universal adapter, you wouldn't need all those old cords! Plug your tool into Encapsulation class and plug that right into Quality Tools for BlueJ Extension and off you go, adding custom code to bring the full power of your favorite tool to bare in BlueJ!
